

CSM Agent — Testing Guide

Loop Services Project Dashboard · Customer Success layer · prompt version 2026-09-25.1

Nothing can reach a customer during this test.

There is exactly one code path that sends a CS draft, and it requires a signed-in reviewer to press "Approve & send" with a recipient address. The agent has no send tool defined, and the nightly worker runs with no mailbox to send from. Running the agent writes a database row and nothing else.

Step 1 — Run two SQL files

In Supabase, open SQL Editor and run these in order. Both are safe to re-run.

```
supabase/cs-phase-a.sql  
supabase/cs-agent-runs.sql
```

The first adds opt-out, suggested roles and the active-negotiation flag. The second creates the agent run table and the draft columns. If you skip them the agent returns an error naming the file it needs.

Step 2 — Prepare one account

The agent refuses an account with no profile, and will not write to anyone whose role is unset. Pick an account you know well — Salt and Stone, Oxide and Yield Engineering have the most material behind them.

1. Customer Success → open the account → check a profile exists. If not, Extract one.
2. CRM → Accounts → the same account → Contacts. Set a role on at least one person. Try Suggest roles first, but expect it to decline most: only 68 of 949 contacts have a job title, which is the only thing a role can be inferred from.
3. Confirm the account has an open flag in Triage. Without one the health check motion has no trigger and the agent will correctly refuse to use it.

Step 3 — Run it

Customer Success → the account → scroll to **CSM agent** → Run CSM agent. It takes roughly 30 to 90 seconds and shows elapsed time while it works.

When it finishes, open the expander at the bottom of the panel. That is the transcript: every tool it called and what came back. It is the most useful part of the whole feature — a decision agent you cannot interrogate is one you cannot trust.

Step 4 — Read the outcome

OUTCOME	WHAT IT MEANS
Drafted	It wrote something. Open the Draft Queue to read it — rationale, cited facts, lint hits and the recipient are all there.
Skipped — no suitable contact	Working correctly. Nobody on the account has a role the motion allows.
Skipped — nothing specific to say	The profile is too thin to write from. That is an upstream data problem, not an agent fault.
Blocked	It decided to write and suppression stopped it. The draft is kept, marked rejected, with the reason.
Needs a person	It raised a human flag: an email is the wrong response here.

The most informative test is an account it should refuse.

Try one with no open flag, or one where you owe the customer something overdue. A well-reasoned skip is the harder behaviour and the one worth trusting. Anything can write an email.

Step 5 — Review a draft (optional)

Customer Success → Drafts. Each item shows why it was generated, the evidence behind it, which suppression checks ran, and the recipient pre-filled from the contact the agent chose. Editing before sending is expected — the difference between what was generated and what you send is the most valuable feedback in the system, and it is retained.

Sending is a deliberate act.

Approve & send re-runs every suppression check first, refuses an expired draft, and sends from your own mailbox. If you do not want to send anything yet, simply do not press it. Drafts expire on their own after 14 days.

Step 6 — Check the numbers

Customer Success → Agent. Proposed against skipped, sent unedited against edited, rejection reasons, skip categories, and tokens per run. It is empty until you have run a few.

Rejection reasons are split into two groups on purpose. "Wrong person" and "wrong timing" are decision failures — the agent chose badly. "Tone off" and "factually wrong" are writing failures. They need different fixes, and a change that helps one can easily worsen the other.

What it cannot see

—

Email. The app has no Gmail read scope, so the agent sees meetings but not correspondence. It is told this explicitly and told to prefer skipping when an account looks quiet but it cannot confirm that. Adding the scope is a Workspace admin change on the existing service account — no user re-consent.

- **Replies.** For the same reason, reply rate cannot be measured. It is shown as an explicit gap rather than left off the list.
- **Commercial values.** Deliberate. It gets contract dates so it can time outreach, never amounts.

Before you turn on the nightly job

The schedule is already in vercel.json.

It will begin on your next deploy if your Vercel plan allows sub-daily crons (`* /5 7-8 * * *`). If you want to hold it back, delete that line from `vercel.json`. The manual button is unaffected either way.

The recommendation from the specification is to run it manually on ten accounts where you already know the right answer — some that should be emailed, some that should not, one where you owe the customer work — and to be satisfied with at least eight, including the rationales.

Then check tokens per run on the Agent tab before letting it process ten a night.

Known limits worth expecting

- **Contact roles are mostly unset.** 14 of 458 contacts on won accounts have a job title. Expect skips for "no suitable contact" until roles are filled in by hand. This is the single biggest thing limiting the agent today.
- **Commitments start empty.** They accumulate as you process meetings through the wizard. Until then the agent is told that the absence of commitments is unknown rather than clear.
- **The release motion is not wired.** It will refuse and say so.

If something goes wrong

SYMPTOM	CAUSE
Error naming a .sql file	That file has not been run in Supabase yet.
"has no profile"	Extract a profile on the account first.
Always skipping, no suitable contact	No contact has a role. Set one in CRM → Contacts.
Run says it hit a budget	It was forced to decide early. That is a default, not a considered call — re-run it.
Agent tab is empty	Nothing has run in the selected window. Try 90 days.
